

Safari Snorkel - SS581HF

The Safari SS581HF snorkel is tough, stylish and has been designed to deliver a huge volume of the coolest and cleanest air possible into the stock air cleaner assembly of the TD4 Land Rover Defender.

Right from the start, Safari took the decision to develop a snorkel system that exceeded the huge mass air flow requirements of the gutsy 2.4L Turbo Diesel engines - and through thorough engineering and exhaustive testing of the SS581HF snorkel system, those lofty design targets were achieved.

Close attention to the internal cross sectional profile, area, air velocity and flow path through each and every point along the entire length of the snorkel system ensures that the greatest air flow is achieved. The result is maximum engine performance and the best possible fuel economy.

By utilizing the original ducting and air cleaner assembly - without compromising air flow means that the Safari snorkel systems delivers the maximum convenience for those who wish to

install additional under-hood accessories.

Huge air flow is but one aspect of the ultimate in snorkel design. The Safari air ram is designed to perform two very important roles. The most obvious is to funnel cool clean air into the snorkel body - but just as importantly, the Safari air ram acts as a highly efficient water separator to remove rain water from the incoming air stream - thus ensuring safe engine operation through even the most torrential tropical storms.

In addition, the detachable Safari air ram can be rotated to any position. This means great peace of mind for those who plan to travel in cold or high altitude conditions where heavy snow falls are

anticipated. By rotating the air ram to face away from the prevailing wind/direction of motion, the air ram delivers additional protection from the choking effects of snow build-up inside the air intake.

The Safari Snorkel body and air ram are manufactured to the highest standards in durable, UV stable, cross linked polyethylene material. In addition, the substantial material wall thickness delivers huge physical strength to ensure that the snorkel breezes through the toughest off-road conditions on the planet.

The Safari Snorkel system is supplied as a complete and comprehensive system that includes every nut, bolt and bracket required for installation - right from robust zero-corrosion stainless steel studs, self-locking nyloc nuts and large diameter anodized body washers through to the tough plastic A-pillar inserts.

An accurately marked template is also provided to ensure that the installation of the snorkel body to panel work is as precise as possible and eliminates any guess work where holes need to be drilled.

Breathe Easy - The genuine Safari Snorkel is positively sealed and delivers a continuous and cooler supply of air for the best engine protection on the planet.
