

Unit 626 Kilshane Avenue, North West Business Park, Ballycoolin, Dublin 15, Ireland Telephone: +353 1 8612 632, Fax: +353 1 8612 647, email: sales@driveriteltd.com

# W21-760-2445

## **INSTALLATION INSTRUCTIONS**

All work should be carried out in a properly equipped workshop with due regard to Health and Safety Regulations. No further reference to Health and Safety Regulations will be made, but they must be considered at all times.

The kit should be opened and the contents checked against the parts list provided. Identify the various components and familiarise yourself with them using drawings and information provided.

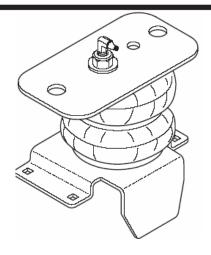

#### **WARNING**

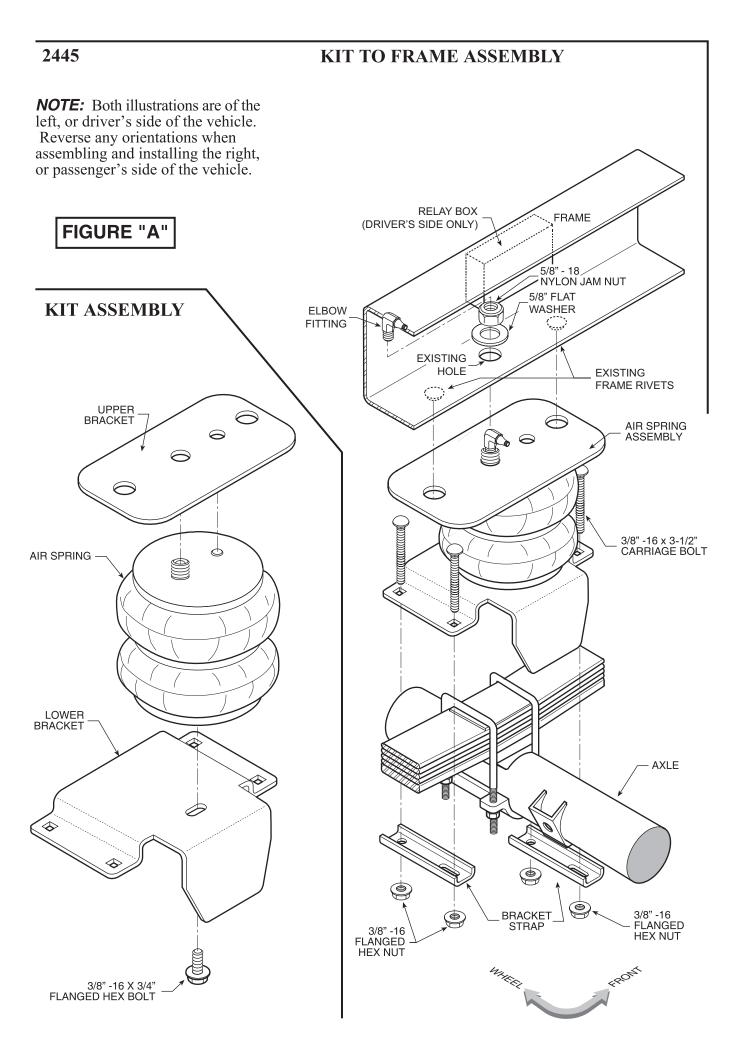

Do not inflate this assembly when it is unrestricted. When installed, a minimum of 10 psi should be maintained in the air bellows at all times to avoid damage. Do not inflate beyond 100 psi.

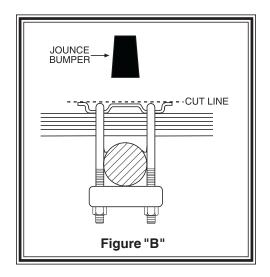

### **IMPORTANT**

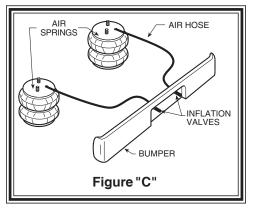

This kit is not designed to increase the GVW of your vehicle. For your safety and to prevent possible damage to your vehicle, do not exceed the maximum load recommended by the vehicle manufacturer.

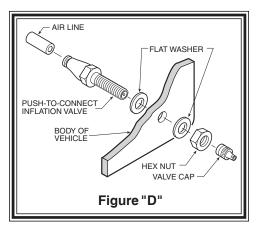

AIR SPRING	6397	2	5/8"-18 JAM NUT		2
UPPER BRACKET	5542	2	5/8" FLAT WASHER		2
LOWER BRACKET	5543	2	5/16" FLAT WASHER		4
1/2" BRACKET STRAP	5086	4	ELBOWFITTING	3128	2
18 ft. TUBING		1	INFLATION VALVE	3032	2
3/8"-16 x 3-1/2" CARRIAGE BOLT		8	NYLON TIES		6
3/8"-16 FLANGE LOCK NUT		8	THERMALSLEEVE		2
3/8"-16 x 3/4" FLANGE BOLT		2	CAUTIONTAG		2

#### STEP 1 - PREPARE THE VEHICLE

Place the vehicle on a solid level surface. Take necessary safety precautions such as using wheel chocks when working under your vehicle. Remove the jounce bumpers by cutting them off as close to the bracket as possible as shown in *Figure "B"*. Next, loosen the two nuts on the fuel relay box and move to the side.

#### STEP 2 - PREASSEMBLE THE KIT

Select an upper bracket and an air spring from your kit. Place the bracket on top of the air spring so the alignment pin inserts into the small middle hole, and the large combination stud inserts into the large middle hole. Attach the lower bracket to the air spring using the 3/8"-16 x 3/4" hex bolt. Tighten the bolt making sure the bracket is in the correct position (*see Figure "A"*).

## STEP 3 - INSTALL THE PREASSEMBLY TO THE VEHICLE

Place the preassembly on the leaf stack of the vehicle as shown in *Figure* "A". The emergency brake line bracket may need to be bent slightly for proper clearance. Align the two rivets on the bottom of the frame with the large holes on the outside of the upper bracket. Insert the large combination stud into the existing hole on the bottom of the frame. Install the 5/8" washer and the 5/8"-18 nylock jam nut onto the combination stud and tighten. See Figure "A". Install the elbow fitting into the air spring. Tighten the air fitting hand tight, then 3/4 of a turn with a wrench. DO NOT OVER TIGHTEN. If the nylon ring is crushed, it will cause an air leak. (see Figure "A"). Attach the lower bracket to the leaf stack using the 3-1/2" carriage bolts, 3/8" lock nuts, and bracket straps as shown in Figure "A". Replace the fuel relay box.

Follow the same procedures as outlined in steps 1 through 3 for installing the right side of the vehicle.

## STEP 4 - INSTALL THE AIR LINE

Uncoil the air tubing and cut it into two equal lengths. *DO NOT FOLD OR KINK THE TUBING*. The air line tubing should not be bent or curved sharply as it may buckle with age.

Make the cut as square as possible. Insert one end of the tubing into the elbow fitting installed in the top of the air helper spring.

Select a location on the vehicle for the air inflation valves. The locations can be on the bumper or the body of the vehicle but be sure that it is in a protected location so the valve will not be damaged yet still be accessible for the air chuck (see Figure "C"). Drill a 5/16" hole or use an existing hole and install the air inflation valve using two 5/16" stainless steel flat washers per valve as supports (see Figure "D"). Run the tubing from the air spring to the inflation valve, routing it to avoid direct heat from the muffler or tailpipe, and away from sharp edges. Tubing protectors have been provided for these conditions. Push the end of the air line tubing into the inflation valve as illustrated (see Figure "D"). Secure the tubing in place with the nylon ties provided.

#### STEP 5 - CHECK THE AIR SYSTEM

Once the inflation valves are installed, inflate the air springs and check the fittings for air leaks with an applied solution of soap and water. If a leak is detected at a tubing connection then check to make sure that the tube is cut as square as possible and that it is pushed completely into the fitting. The tubing can easily be removed from the fittings by pushing the collar towards the body of the fitting and then pulling out the tube. If a leak is detected where the fitting screws into the spring, screw the elbow into the spring until the leak stops. Reinflate the air helper springs and check for leaks as noted above. Further information on trouble-shooting can be found in the General Operation Instruction book included with this kit.

This now completes the installation. Before proceeding, check once again to be sure you have proper clearance around the bellows. With a load on your vehicle and the helper air springs inflated, you must have at least 1/2" clearance around the bellows. As a general rule, the Ride-Rite Air Helper Springs will support approximately 32 lbs. of load for each p.s.i. of inflation pressure (per pair). For example, 50 P.S. I. of inflation pressure will support a load of 1600 lbs. per pair of air helper springs. FOR BEST RIDE use only enough air pressure in the air helper springs to level the vehicle when viewed from the side (front to rear). This amount will vary depending on the load, location of load, condition of existing suspension and personal preference.

**NOTE:** Too much air pressure in the helper springs will result in stiffer ride, while too little air pressure will allow the air spring to bottom out over rough conditions. Too little air pressure will also not provide the improvement in handling that is possible. **TO PREVENT POSSIBLE DAMAGE MAINTAIN A MINIMUM OF 5 P.S.I. IN THE RIDE-RITE AIR SPRINGS AT ALL TIMES.** 

### **NOTE:**

Once the air helper springs are installed, it is recommended that the vehicle not be lifted by the frame, as over-extension may occur, resulting in damage to the air helper springs. However, should it become necessary to raise the vehicle by the frame, deflate both air helper springs completely.

Note:

MIN PRESSURE 5 PSI

MAX PRESSURE (LOADED) 100 PSI
